DESCRIPTION

In its most basic form, modern teaching methods are a teaching style that focuses on teaching students how to enhance their cognitive behaviour via the use of several fresh and imaginative ideas rather than having them repeat the syllabus in order to pass the exam in the same old way.

Changes in teaching style have been seen over time. In contrast to memorization and the same old recitation exercise used to educate pupils in the past, interactive teaching tactics were introduced using current teaching methodologies, and the results can be observed. This is an educational reform that provides a whole new viewpoint on teaching and learning since, unlike conventional teaching methods, current teaching tactics do not treat all pupils at the same level of comprehending capacity. Modern teaching techniques, rather of relying solely on the instructor, place a greater emphasis on questioning, demonstrating, explanation, practical strategies, and cooperation strategies, and are more activity-based.

Modern Teaching Methods are the face of education, like that of other sectors, has changed dramatically throughout time. Teachers have hitherto been the most effective means of bridging the gap between education and pupils. To teach the subject topic or offer notes, they used typical instructional tactics. Modern education, on the other hand, perceives a significant situation that motivates students to study deeply and to satisfy their curiosity. In recent years, we've been exposed to novel modern teaching techniques, and the introduction of technology together with innovative educational approaches has ushered in a revolution in the education sector. So, let's talk about whatever innovative teaching methods are available.

Following are the modern teaching strategies: Collaborative Learning is learners used to revise the topic or syllabus in isolation or in a room when they were expected to do so during an exam or on a regular basis. In older teaching approaches, this

practise was widespread. Colleges are developing collaborative learning as a solution to this problem or as an additional valuable platform for students. Teachers form a group of students in this modern teaching technique so that they may work out their difficulties, discuss themes, and get answers to their questions. This promotes the development of social skills and allows students to grasp the material more quickly.

Spaced Learning is one of the contemporary teaching strategies that is accompanied by instructors is spaced learning. Teachers use this method to repeat a lesson a few times until the students understand it completely. The teacher, on the other hand, repeats the course with 10-minute breaks (breaks) in between the courses. The gap is designed to refresh students' minds by engaging them in entertaining activities, preparing them for the next session of the same course. This strategy provides learners with opportunities to inherit information and make connections between learnings at regular intervals. This strategy equips the learners with the fundamentals before going on to the next chapter.

The term "flipped classroom" refers to a method of teaching that in the pedagogical field, the term "flipped classroom" is well-known. You are without a doubt aware of this. It is distinguished by its title, 'Flipped Classroom.' It was one of the most influential modern teaching methods at the time. In this method of instruction, the teaching process is reversed. Unlike traditional teaching methods, students study new content or topic material at home before practising it at college. Instead of obtaining material at the institute, the technique requires students to review or practise it at home. Learners may put this method into practise at home by viewing a video tutorial, looking online, or working on the material that the teacher generally offers. They are adamant that they will not finish their homework at home.

It is common knowledge that youngsters like video games, whether they are played online or on the field. Teaching with video games is one of the most important contemporary teaching

tactics that has been applied under cutting-edge coaching methodologies. The importance of gamification in education has been extensively recognised in elementary and preschool devices. The fact that students are learning through video games will go unnoticed by them. It had an effect on pupils as well, and it proved to be beneficial not just for preschoolers, but also for students of all ages.

VAK teaching is a cutting-edge teaching method with demonstrable outcomes. Visual, auditory, and kinesthetic

learners are the three categories of learners (movement). One must know which kind they fall into, or a trainer must know which group her trainees fall into. In VAK, V represents a visual way of viewing data, A represents an auditory way of gathering data by listening, and K represents a kinesthetic way of feeling the data. Because some students learn by seeing, hearing, or feeling, a teacher must keep this type of students in mind when teaching. As a result, they should communicate the same information in a variety of methods.
