EDITORIAL NOTE

International Journal of Medical Sociology and Anthropology is a peer-reviewed, have a short turnaround time from submission to publishing, and there's no length limit. Therefore, I am delighted to launch the International Journal of Medical Sociology and Anthropology, which was founded to serve as a central centre for disseminating new clinical findings and discoveries to Medical Sociology and Anthropology researchers around the world. IJMSA is an open-access, worldwide, peer-reviewed journal published articles online that will give a forum for improvements in Medical Sociology/Anthropology. This multidisciplinary publication is intended for a broad audience of medical sociology and anthropology. Original research and ideas, as well as reviews, communications, short notes, and book reviews, will be presented in each edition of the journal, which will cover all areas of medical sociology. The duration of our publications is unrestricted due to our online nature. We are encourage authors to describe their findings and outcomes in as much detail as necessary so that our readers may fully comprehend how and why they conducted their research or worked up their patient.

The journal welcomes significant research articles that provide a sociological analysis of medical organisations and institutions, the production of knowledge and method selection, the actions and interactions of healthcare professionals, the social or cultural as well as clinical or bodily effects of medical practise, the sociology of knowledge, science and technology studies, and the sociology and technology studies, Social epistemology examines phenomena at the intersection of the social and clinical sciences,

the totality of human health and disease, health care systems, and biocultural adaptation.

It frequently works at the intersections of public health, social work, demography, and gerontology to investigate phenomena at the intersection of the social and clinical sciences, the totality of human health and disease, health care systems, and biocultural adaptation. IJMSA maintains a double-blind peer-review system, in which the reviewers of the manuscript are unaware of the author identity, and the author is unaware of the reviewer's identity. The benefit of double-blind peer review is that it removes any potential for prejudice.

To create a global and interdisciplinary venue for the dissemination of health-related social science research. Original research articles (both empirical and theoretical), reviews, position papers, and commentaries on health issues are published to inform current research, policy, and practise in all areas of interest to social scientists, health practitioners, and policymakers. The journal publishes material from a wide range of social science disciplines (anthropology, economics, epidemiology, geography, policy, psychology, and sociology) that is relevant to any aspect of health, as well as material from any of the professions concerned with physical and mental health, health care, clinical. practise, and health policy and organisation that is relevant to the social sciences. We seek submissions that are of general interest to a global audience.

I would like to express my gratitude for the final editing of the published articles by all writers, reviewers, and other supportive groups, as well as the editorial assistant's assistance in the quick settlement of IJMSA concerns. I owe them a debt of gratitude for motivating me to appreciate the efforts and progress of other organisations that enable me to the publish articles successfully.
